2 Abstract of the Disclosure
3

4 A circular power saw (10), composed of a saw assembly (12) with a housing (14,
5 16) that encloses a motor and a saw blade (18) capable of being driven by the
6 motor, and that includes a handle, whereby the saw assembly (12) is pivotably
7 supported relative to a footplate (22) such that it can be adjusted between a
8 minimum and maximum cutting depth, is protected against kickback by the fact
9 that, during sawing, the saw assembly (12) is decoupled from handling forces
10 acting on the saw blade (18), in particular from the handle (24).
